

# CMM536 Topic 9 - GPT

### Content

1. (Vanilla) CNN is just the start!

2. P: Pre-Trained Models → Transfer Learning

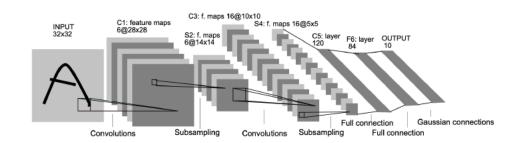

3. G: Generative Models

4. T: Transformers!

## (Vanilla) CNN is just the start!

- The network we saw last week is often called "LeNet" or "Vanilla-CNN"
- It was "tailor-made" to solve the MNIST problem, although it could solve many more!
- The biggest drawback is that the filters used are too simple to tackle other challenges!

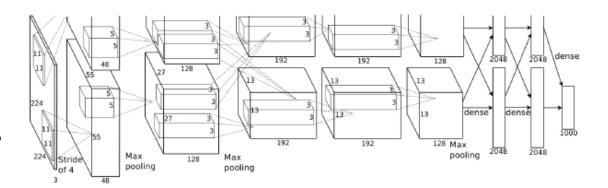

Y. LeCun et al., "Gradient-based learning applied to document recognition". Proceedings of the IEEE, vol. 86, no. 11, pp. 2278-2324, 1998, doi: https://doi.org/10.1109/5.726791

### **AlexNet**

- Won the 2012 ImageNet ILSVRC challenge (by a large margin).
  - Achieved top error rate of 17% (second best achieved only 26%)
- It is much larger and deeper than LeNet, and the authors used dropout and data augmentation to reduce overfitting
  - It was the first network trained in a GPU, thanks to Krizhevsky's gaming expertise!

A. Krizhevsky et al., "ImageNet classification with deep convolutional neural networks". Proceedings of the 25th International Conference on Neural Information Processing Systems (NIPS) 2012, doi:

https://dl.acm.org/doi/10.5555/2999134.2999257

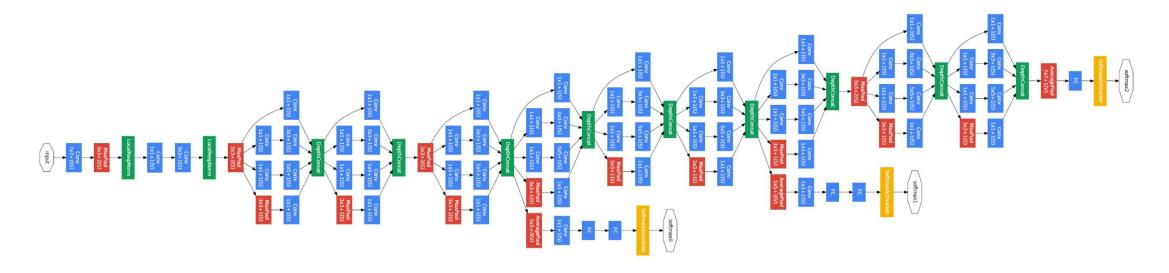

### GoogLeNet

- Won the ILSVRC challenge in 2014, developed by Szegedy et al.
  - Much deeper network than previous CNNs (one early version is made of 22 conv layers!)
- Several extensions of GoogLeNet were developed later by Google researchers, most notably the Inception architectures
  - Allow the network to choose between multiple convolutional filter sizes in each block.
  - An Inception network stacks these modules on top of each other, with occasional max-pooling layers with stride 2 to halve the resolution of the grid

C. Szegedy et al., "Going deeper with convolutions". Proceedings of the IEEE Conference on Computer Vision and Pattern Recognition (CVPR), 2015, doi: <a href="https://doi.org/10.1109/CVPR.2015.7298594">https://doi.org/10.1109/CVPR.2015.7298594</a>

## GoogLeNet

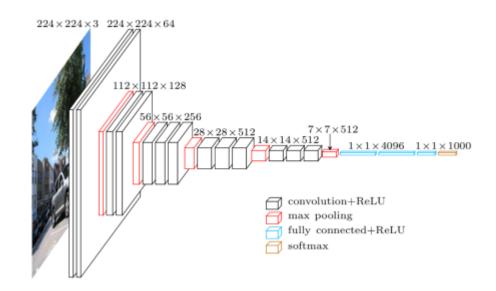

https://paperswithcode.com/method/googlenet

## Visual Geometry Group (VGG)

- Very deep architecture of 16 or 19 layers in total
- Designed to have 2 or 3 conv layers, and a pooling layer, then again 2 or 3 conv layers followed by a pooling layers to reach 16 layers (in VGGNet16) and 19 layers (in VGGNet19)
- Used for multiple object detection.

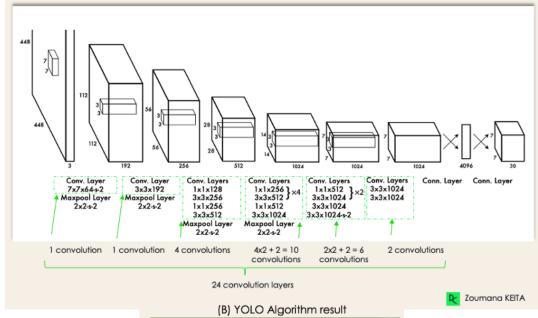

K. Simonyan and A. Zisserman, "Very Deep Convolutional Networks for Large-Scale Image Recognition". International Conference on Learning Representations (ICLR) 2015, doi: <a href="https://arxiv.org/abs/1409.1556">https://arxiv.org/abs/1409.1556</a>

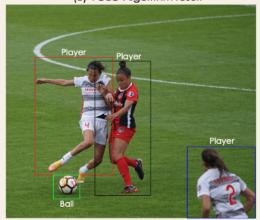

https://www.datacamp.com/blog/yolo-object-detection-explained

## You Only Look Once (YOLO)

- One of the most popular architectures in recent times
- Authors framed object detection as a regression rather than a classification problem by spatially separating bounding boxes and associating probabilities to each of the detected images using a single CNN
- Architecture similar to GoogLeNet
  - 24 convs. 4 max pool, 2 FCN
- Advantages: Speed, accuracy, generalisation, open source

Redmond et al., "You Only Look Once: Unified, Real-Time Object Detection". ArXiV 2015, doi: https://arxiv.org/abs/1506.02640

### ResNet

- Training very deep networks proved to be problematic and can cause problems such as vanishing/exploding gradients
- However, ResNet made it possible to train a very deep network without harming the performance
  - Residual: Learning from a reference rather than the direct output

#### https://paperswithcode.com/method/resnet

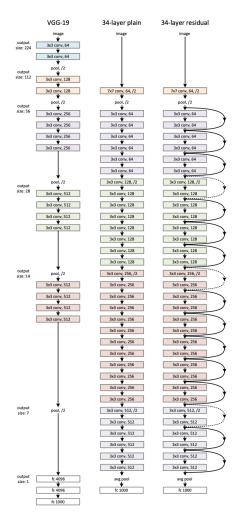

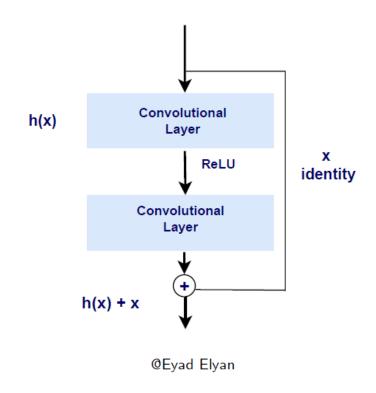

Figure 3. Example network architectures for ImageNet. Left: the VGG-19 model [41] (19.6 billion FLOPs) as a reference. Middle: a plain network with 34 parameter layers (3.6 billion FLOPs). Right: a residual network with 34 parameter layers (3.6 billion FLOPs). The dotted shortcuts increase dimensions. Table 1 shows more details and other variants.

He et al., "Deep Residual Learning for Image Recognition". Proceedings of the IEEE Conference on Computer Vision and Pattern Recognition (CVPR) 2016, doi: <a href="https://arxiv.org/pdf/1512.03385.pdf">https://arxiv.org/pdf/1512.03385.pdf</a>

### ResNet

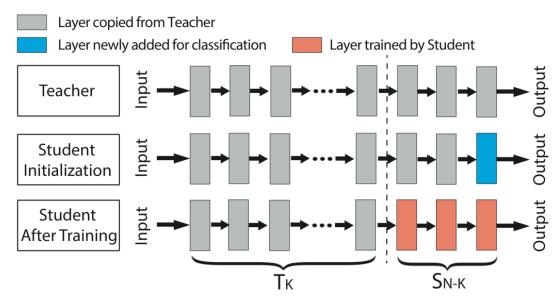

- Recall that the target of training is to model a function h(x), and so
  if you add input x to the output of the network (add a skip
  connection), then the network will end up modelling f(x) = h(x) x
  instead of h(x)
  - This is called residual learning
- At the start of the training, the weights are initialized to be close to zero, so the network will simply output values close to zero.
- When adding the skip connection, the network will end up outputting a copy of its inputs.
  - This simply means if the target function is close to the identity function (often the case)
- This will speed up the training process and the network can start making progress even if some layers haven't started learning yet.

## Pre-Trained Models -> Transfer Learning

- (Almost) nobody implements these modules from scratch
  - Use pre-trained models with a single line of code!
- Most have been trained on large volumes of data (e.g. ImageNet which has 1 million images)
  - Therefore, they "know" how to recognise the most basic objects (e.g. people, vehicles, animals)
  - We "freeze" the lower layers and train the higher ones (fine-tuning).
  - Obviously, you also need to change the output layer (to predict your labels)
  - As a result, you need less training data to achieve better results

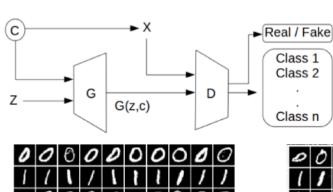

https://bdtechtalks.com/2019/06/10/what-is-transfer-learning/

### **Generative Models**

- While the previous models classify/detect data better, attempts were made to make them generate data in parallel
- Goodfellow et al. realised that if you train two DNNs to compete against each other, not only they can classify better, but also, they can generate images better!
  - One model is called the generator, and the other one is the discriminator
  - The generator tries to create simples close to the original, and the discriminator tries to identify real from fake
  - Gradually, the generator will improve and beat the discriminator (and possibly you!)

Goodfellow et al., "Generative Adversarial Nets". Proceedings of the 27th International Conference on Neural

Information Processing Systems (NIPS) 2014, doi: <a href="https://doi.org/10.48550/arXiv.1406.2661">https://doi.org/10.48550/arXiv.1406.2661</a>

### **Generative Models**

• At the moment, there's more than 1000 different GANs!

 https://github.com/hindupuravina sh/the-gan-zoo

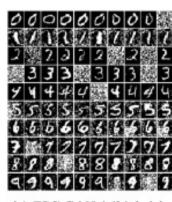

(a) Original MNIST data

(d) Original MNIST data

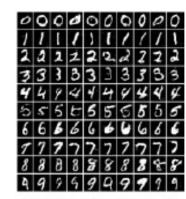

(b) FSC-GAN (10k labels)

(e) FSC-GAN (all labels)

(c) MFC-GAN (10k labels)

(f) MFC-GAN (all labels)

### **Transformers**

- https://colah.github.io/posts/2015-08-Understanding-LSTMs/
- <a href="https://www.turing.com/kb/brief-introduction-to-transformers-and-their-power">https://www.turing.com/kb/brief-introduction-to-transformers-and-their-power</a>
- There were previous attempts at understanding sequential data and adding "memory" to NNs
  - Examples include Recurrent Neural Networks (RNNs) and Long-Short Term Memory (LSTM)
- However, in 2017, Vaswani et al. cracked a way to not only understand sequential data, but also to introduce "attention" mechanisms!
  - In fact, it is based on RNN but it is not sequential!
  - Encoder & Decoder using embedded text data

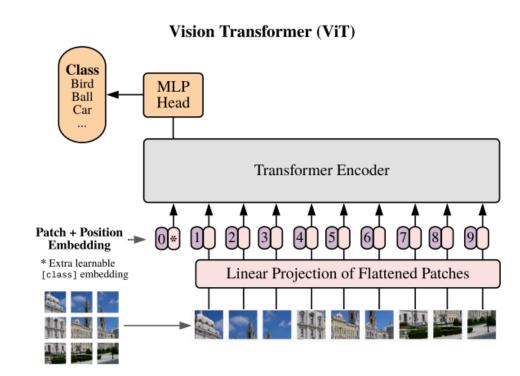

Linear Add & Norn Add & Norm Add & Norm Feed Forward Add & Norm Add & Norm MUlti-Head Output Embedding **7** Turing

Vaswani et al., "Attention is all you need". Proceedings of the 31st International Conference on Neural Information Processing Systems (NIPS) 2017, doi: <a href="https://doi.org/10.48550/arXiv.1706.03762">https://doi.org/10.48550/arXiv.1706.03762</a>

### **Vision Transformers (ViT)**

- Dosovitskiy et al. "borrowed" this idea and implemented it for images!
- The method Works very well, but it has high computational demand
- Currently, they are the closest competitor vs
   CNN based architectures
  - Although you could "freeze" layers from a CNN and use their output to train a ViT instead of 16x16 patches!
- Most likely use: Action recognition
  - They can recognise "complex" actions

Dosovitskiy et al., "An image is worth 16x16 words: Transformers for Image Recognition at Scale". Proceedings of the 9<sup>th</sup> International Conference on Learning Representations (ICLR) 2021, doi: <a href="https://doi.org/10.48550/arXiv.2010.11929">https://doi.org/10.48550/arXiv.2010.11929</a>

## Other interesting models to explore

- (Variational) Autoencoders
  - Feedforward networks to solve unsupervised learning

- U-Net
  - The best option for medical image segmentation
- Self Organising Maps (SOMs)
  - PCA for images!
